SECURITY MANAGEMENT

Technology Management
for
Manufacturing

Cybersecurity must be a priority for any data-driven business.
Up to date systems, software, hardware and policies will keep your business data secure,
avoiding potential liability, loss of productivity or information.

Manufacturing Business

The client is a local manufacturer with approximately $17 million in yearly revenue.

Their Challenges

The client faced a very high risk of system downtime, data loss, and cybercrime.

Our Diagnosis

The client found themselves completely lacking in several critical areas of security. They had:
- no Backup & Disaster Recovery plan in place
- no defined password policy
- old users on the active directory
- never-expiring passwords
- old computers

--all saved in an unorganized fashion.

CASE STUDY

Our Solution

After an initial analysis of the client's network, systems and infrastructure, we outlined the risks they face, and the potential solutions. We:
- drafted and implemented a Back up & Disaster Recovery plan along with our Backup Continuity Disaster Recovery (BCDR) system. These will protect the data stored in their four critical server systems;
- upgraded or replaced their existing network firewalls and network switches, which both made the client more secure and allowed them to properly utilize VOIP phone systems, access server files, and more;
- developed a secure password policy with the client, and cleared their servers of the old junk data.

The Results

The client is working with a system that is much more secure, and much more efficient. With the implementation of a Backup & Disaster Recovery Plan and a strong password policy, the client conducts business knowing that they have the processes in place to keep their data safer.
